TI Hard foam-forming polyurethane and polyurethane-isocyanurate prepn. - by
using polyester-polyol derived from terephthalic acid and/or dimethyl
terephthalate prodn. residue.

Polyurethanes and polyurethane isocyanurates are prepd. by reacting at
least one aliphatic or aromatic diisocyanate or higher-valency
polyisocyanate with a polyol component in the presence of auxiliaries.
Novelty consists in using a polyol component consisting partly or entirely
of a polyester-polyol prepd. by the trans-esterification and/or
polyesterification of an acid component with diol and/or polyols. The acid
component consists, at least partly of the distn.- and/or esterification
residue from terephthalic acid and/or dimethyl terephthalic prodn. The
process is used esp. in polyurethane- and polyurethane-isocyanurate rigid
foam prodn.

The rigid foams can be used for heat-, cold- and sound-insulation,
esp. in the refrigeration- and building industry. Terephthalic acid- and
ester prodn. waste can be used directly and economically, thus solving
pollution problems. The foams have an even structure and resist low temps.
